

I.D. Shield

Automated Redaction for Laserfiche®

ID Shield for Laserfiche®

ID Shield for Laserfiche brings the power of Extract Systems' award-winning redaction technology to your repository.

Solution Highlights

- Proven Solution: ID Shield customers have safely redacted over one billion image pages
- Redact at the touch of a button without leaving Laserfiche Client
- Supports Laserfiche 8.2
- Process large sets of backfile or day-forward documents on one or multiple servers
- Verify redacted documents before processing to ensure highest accuracy
- Comprehensive audit trail

Accuracy

Accuracy is the defining feature of a redaction solution. When redaction software fails to detect just one occurrence of sensitive information, such as a Social Security number, there is a real risk of identity theft. Manual verification/validation costs also increase when redaction software is not highly accurate. ID Shield achieves the industry's highest fully automated accuracy, mitigating the need for extensive verification.

How It Works

ID Shield uses powerful character recognition engines to convert scanned images to a digital format: OCR - Optical Character Recognition for machine print, ICR - Intelligent Character Recognition for handwritten content and MICR - Magnetic Ink Character Recognition for checks and money orders. ID Shield searches the OCR output to determine the presence and locations of sensitive data by applying rules-based logic based on pattern recognition, phrase context and location. An image found to contain sensitive data may be automatically redacted or manually verified. The redaction zone is then "burned-in" to a copy of the image.

National Rule Set™

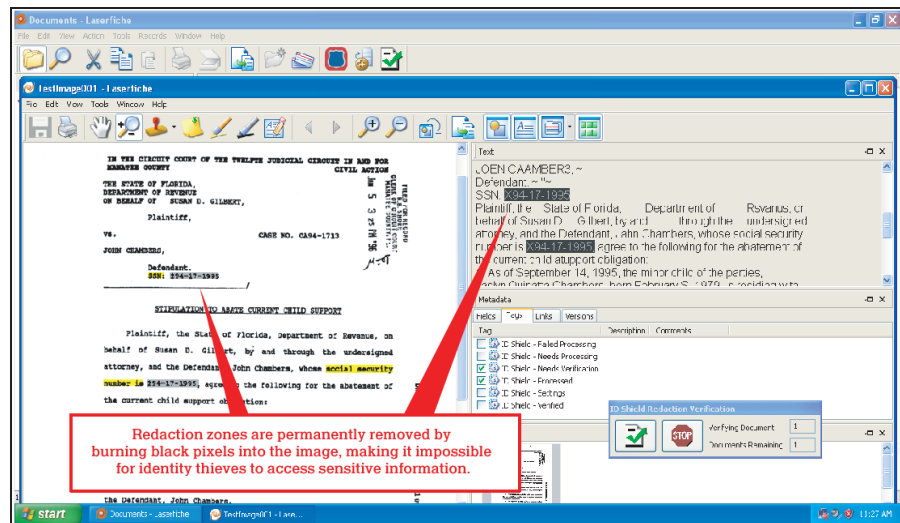

ID Shield's superior accuracy starts with our National Rule Set, the most extensive library of redaction rules currently available on the market. Extract's National Rule Set contains production tested rules for more than 20 sensitive data fields based on the

experience gained from delivering data capture and redaction solutions to hundreds of customers. These advanced detection abilities provide a substantial head start for new customers, speeding deployment and minimizing project costs.

Custom Rule Set

Extract Systems develops custom redaction rules for every project to provide the most precise results of any solution on the market today. The rule-writing team begins with the National Rule Set as the basis and applies additional logic and modifications to meet each customer's unique redaction requirements. This proven process allows every new customer to go into production with a highly effective redaction solution from the very first day, immediately maximizing ROI.

We invite you to contact us to schedule an ID Shield for Laserfiche demonstration. Submit your own set of sample documents to find out how well ID Shield for Laserfiche can perform for you, free of charge.
